

Bing

I understand that you prefer to use Livewire navigation and component class function without a controller. This is possible, but you will need to make some changes to your code.

First, you will need to use the `Route::livewire` method instead of the `Route::get` method to define your routes. This will allow you to pass the Livewire component directly to the route, without using a controller. For example:

```
// routes/web.php
<?php

use Illuminate\Support\Facades\Route;

Route::livewire('/news', App\Http\Livewire\NewsList::class)->name('news.index');
Route::livewire('/news/{id}', App\Http\Livewire\NewsShow::class)->name('news.show');
Route::livewire('/news/latest', App\Http\Livewire\NewsLatest::class)->name('news.latest');
```

Second, you will need to use the `layout` method in your Livewire component class to specify the layout view that you want to use for your component. This will replace the default layout view that Livewire uses. For example:

```
// app/Http/Livewire/NewsList.php
<?php

namespace App\Http\Livewire;

use Livewire\Component;
use App\Models\NewsArticle;

class NewsList extends Component
{
    // The property that holds the news articles
    public $news;

    // The method that runs when the component is mounted
    public function mount()
    {
        // Fetch all the news articles from the database
        $this->news = NewsArticle::all();
    }

    // The method that renders the component's view
    public function render()
    {
        // Specify the layout view to use
        return view('livewire.news-list')->layout('layouts.app');
    }
}
```

Third, you will need to use the `params` method in your Livewire component class to access the route parameters that you want to pass to your component. This will replace the `mount` method that you used before. For example:

```
// app/Http/Livewire/NewsShow.php
<?php

namespace App\Http\Livewire;

use Livewire\Component;
use App\Models\NewsArticle;

class NewsShow extends Component
{
    // The property that holds the news article
```

```
public $article;

// The method that runs when the component is mounted
public function params($id)
{
    // Fetch the news article from the database by id
    $this->article = NewsArticle::find($id);
}

// The method that renders the component's view
public function render()
{
    // Specify the layout view to use
    return view('livewire.news-show')->layout('layouts.app');
}
}
```

I hope this helps you use Livewire navigation and component class function without a controller. For more details, you can check out the [official documentation](#) or some [related questions](#) on Stack Overflow. 😊
